Meeting records [📄 Transcript](#)

Summary

Technology infrastructure discussions drove repository restructuring decisions and upcoming event preparation alignment.

Cloud Versus Local Models

Participants debated deployment strategies, noting preferences for cloud-based agents over maintaining local hardware. Fireworks was recommended as a host for open-weight models.

Repository Structure Redesign

The team decided to rename the hackathon folder to projects and implement a flatter structure. A primary readme will serve as an index for all deliverables.

Event Preparation Coordination

Attendees confirmed plans to utilize organized assets as a foundation for learning at the Amsterdam event. The group established that Slack communication suffices for granting public GitHub contribution credit.

Decisions

Aligned

- **New GitHub repository structure adopted** The GitHub repository structure will be updated to a flatter model, replacing the current 'hackathon' directory with a 'projects' structure, including a top-level README for deliverables and a separate dedicated project folder for hackathon logistical materials.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

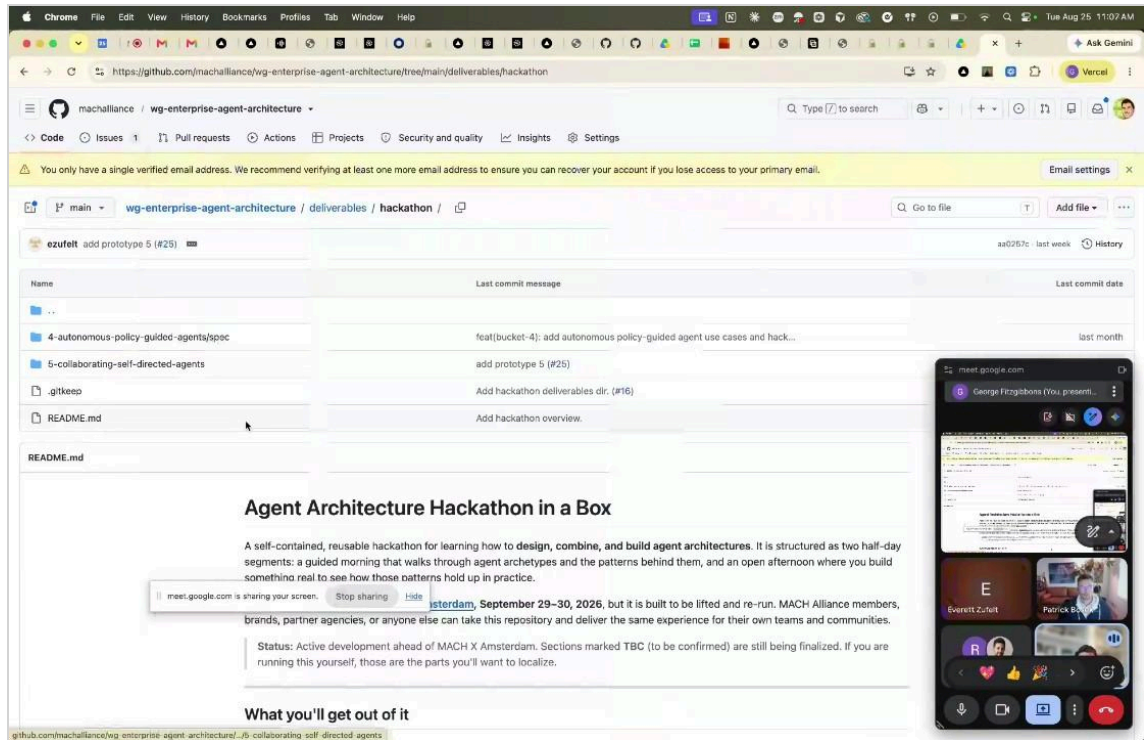

- ☐ [Everett Zufelt] Create Repository Structure: Implement the agreed upon flatter folder structure for the repository to improve project accessibility.
- ☐ [Patrick Bosek] Review Pull Request: Examine the new repository structure and provide feedback on the proposed changes.

- ☐ [Daniele Stroppa] Submit Bucket 4 PR: Upload the bucket 4 project code using the new repository structure format.
- ☐ [George Fitzgibbons] Upload Bucket 3 Examples: Add the bucket 3 documentation and tangible agent project code to the repository.
- ☐ [The group] Confirm Membership Credit: Notify Rebecca on Slack if you wish to be officially credited as a working group member on GitHub.

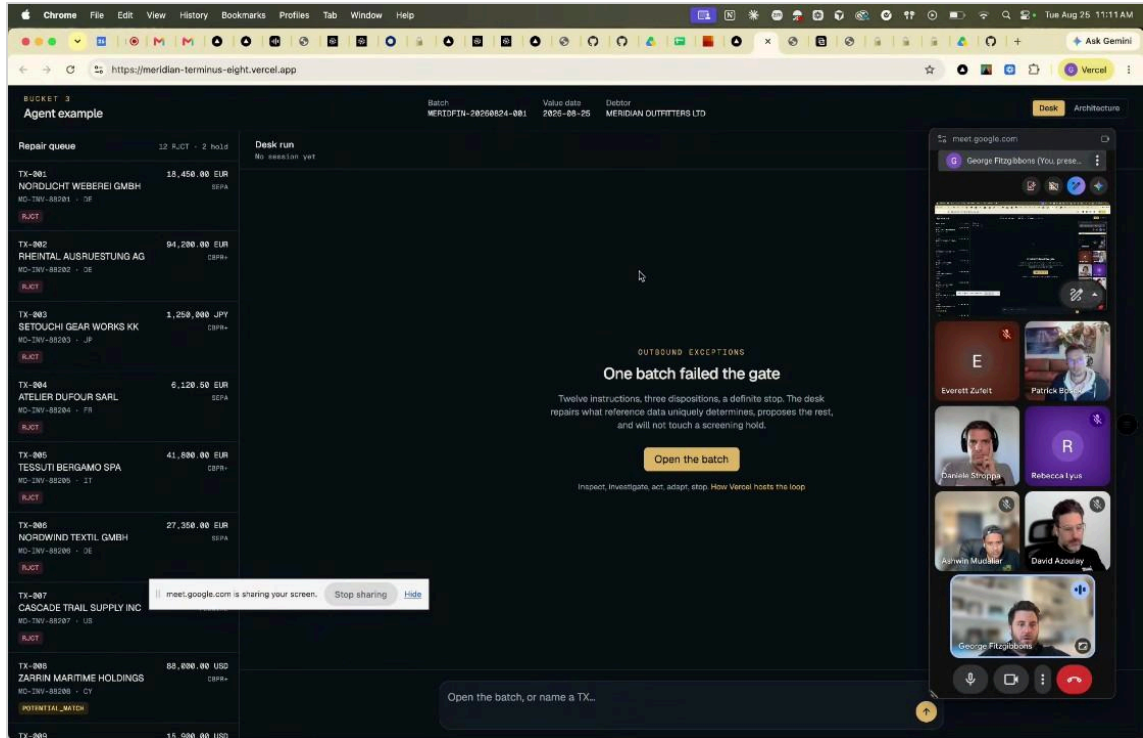

Details

Did the screenshots in this section make your notes [better](#) or [worse](#)?

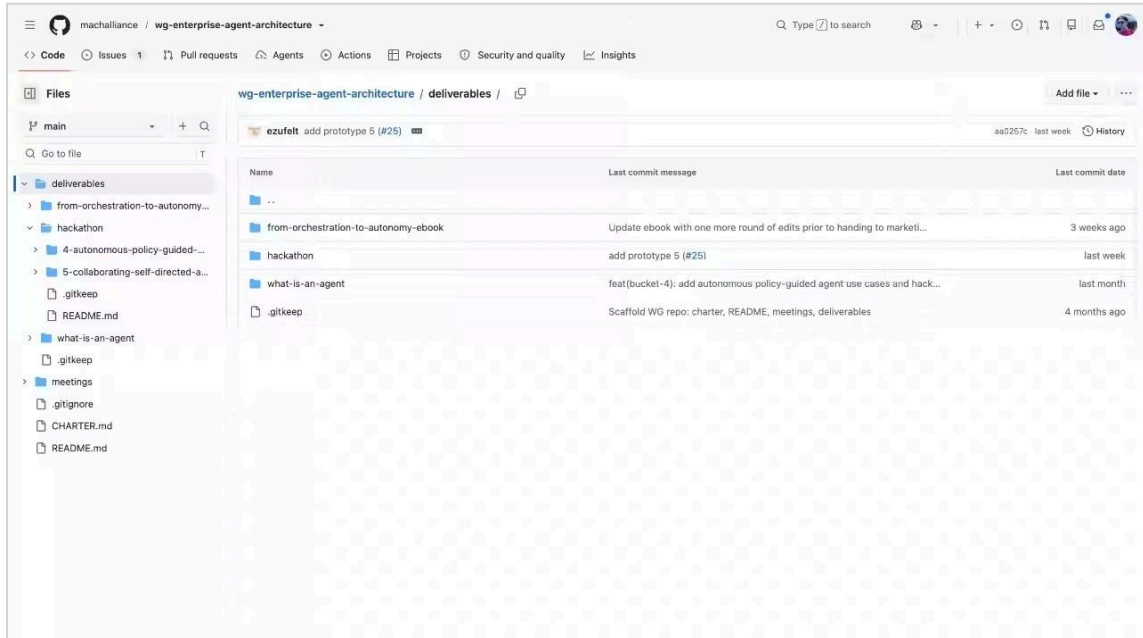

- **Technology Discussion - Local Models and Cloud Providers:** The group discussed their approaches to running AI models, specifically distinguishing between cloud-based providers and running local models. Ashwin Mudaliar noted a preference for cloud agents due to the ease of use and rapid improvements, which avoids the need for maintaining local hardware ([00:02:46](#)). George Fitzgibbons recommended checking out Fireworks, a partner of Ashwin Mudaliar's organization, which hosts open-weight models and was founded by the original team at Meta responsible for PyTorch ([00:04:09](#)).
- **GitHub Repository Organization - Current State:** George Fitzgibbons expressed confusion regarding the current organization of the GitHub repository, specifically noting that open-source projects were placed within a "hackathon" folder. Everett Zufelt explained that the hackathon folder was initially chosen as a convenient location for prototypes currently being built ([00:06:18](#)). The group identified a need to establish a clearer structure for projects, as the current repository lacks a "welcome" area or simple "getting started" instructions to help users navigate the content ([00:07:25](#)) ([00:11:12](#)).

- Defining Prototypes and Documentation:** The participants clarified that "prototypes" refers to the example agents they are building (00:11:12). George Fitzgibbons emphasized the importance of accessibility, suggesting that these projects should include clear readmes with standard installation instructions, such as "npm install," so developers can quickly run the code locally (00:07:25) (00:12:05). Daniele Stroppa noted that current prototypes involve building different pieces rather than a single deployment command, highlighting the necessity of an educational wrapper to guide users through the development process (00:13:20).

- **Proposal for New Repository Structure:** Patrick Bosek proposed a restructuring of the repository to improve clarity, suggesting that the "hackathon" folder be renamed "projects" to better reflect its contents. Their proposal included having a primary readme at the "deliverables" level that acts as an index for all projects, including the bucket classification and status of each. Patrick Bosek recommended a flatter folder structure to avoid complex nesting and to provide a standardized approach where runnable code is clearly distinguished from educational or theoretical documentation (00:17:38) (00:21:59).

- Action Plan for GitHub Restructuring:** The group reached a consensus on the new organizational format (00:19:54). Everett Zufelt agreed to submit a pull request that implements the proposed structural changes, including the move to a "projects" folder (00:18:46) (00:21:59). Daniele Stroppa and George Fitzgibbons committed to submitting their respective bucket prototypes—bucket four and bucket three—using this new format once the pull request is merged (00:23:03).
- Event Coordination - Amsterdam Hackathon:** The team discussed preparations for an upcoming event in Amsterdam, noting that George Fitzgibbons, Everett Zufelt, Rebecca Lyus, and Tim will be in attendance. The plan is to utilize the newly organized tangible assets—including both documentation and runnable agent code—as a jumping-off point for attendees to learn about and build agents (00:24:23) (00:26:49). The participants agreed to hold a side session in the coming weeks to coordinate tactical details for the event (00:26:49).
- GitHub Membership and Credit:** Rebecca Lyus reminded the group that individuals can be credited for their contributions on GitHub, but explicit permission is required to list their names publicly. Participants were instructed to reach out via Slack if they wished to be added as members. Patrick Bosek confirmed that posting in the Slack channel is sufficient for providing this consent (00:29:55).

You should review Gemini's notes to make sure they're accurate. [Get tips and learn how Gemini takes notes](#)

Agent Ecosystem Working Group 1: Enterprise Agent Architecture - MACH Alliance - Transcript

00:01:01

Rebecca Lyus: Hello.

Patrick Bosek: Rebecca, how are you?

Rebecca Lyus: I think we asked how we're doing at the same time.

Patrick Bosek: Oh, yeah. I heard you say good. I'm good, too. Thank

Rebecca Lyus: Good.

Patrick Bosek: you.

Rebecca Lyus: We've got a couple of people now trickling

Patrick Bosek: Hi, George.

Rebecca Lyus: in.

George Fitzgibbons: How's it going?

Patrick Bosek: Good. How are you?

George Fitzgibbons: I'm all right.

Patrick Bosek: I'm just got my copy of From Orchestration to Autonomy. Just started reading it this morning.

George Fitzgibbons: Beautiful. What do you think?

Patrick Bosek: Uh well, I'm only 10 pages in so far. It makes sense.

George Fitzgibbons: Yeah, it's a long one. Everything's too long.

Patrick Bosek: Yeah.

George Fitzgibbons: Yeah. Makes writing too

Patrick Bosek: Well,

George Fitzgibbons: easy.

Patrick Bosek: how much of this was written with AI? Do you know?

George Fitzgibbons: I'm not going to speak for anybody else, but I'll speak for myself.

Patrick Bosek: Microphone's like falling off here. What's going on? What's happening?

00:02:46

Patrick Bosek: I believe my children have been playing with my

Rebecca Lyus: Oh

Patrick Bosek: microphone.

Rebecca Lyus: no. Is it a little bit off?

Patrick Bosek: Yeah, it was just like unscrewed somehow,

Rebecca Lyus: Oops.

Patrick Bosek: which I don't actually know how they accomplished that, but I definitely didn't do it. And I know that one of my sons finds this microphone because it's on like an arm. He thinks it's like a robot. Um, and he thinks it's really fun to play with it.

Rebecca Lyus: Oh.

Patrick Bosek: I'm curious, are the people here running any local models or are you guys all using um like cloud-based providers for your

Ashwin Mudaliar: cloud-based providers.

Patrick Bosek: models?

Ashwin Mudaliar: Um, and then uh either local agents or cloud agents. Um I I've been too lazy to go and try to get hardware to to set up anything and I feel like the cloud agents especially are just making so many improvements on like a you know daily basis

and at least for my needs right like it's mostly kind of production stuff. We're all you know like our stuff you know our company has all Devon everything and so it's just so easy not to have to worry about setting up your own local infra

00:04:09

Patrick Bosek: Yeah.

George Fitzgibbons: Are you talking about models like Kimmy?

Patrick Bosek: Like Yeah. Yeah, like can make quen that kind of stuff like local models. Um any of the the micro models

George Fitzgibbons: Yeah.

Patrick Bosek: basically?

George Fitzgibbons: Starting to more. Uh, I really like fireworks. I don't know if you check them out. We're hosting some of the openw weight model stuff. Uh,

Patrick Bosek: No.

George Fitzgibbons: I think I'm very I think that's going to be people are just going to use it more and more. I don't know why not. So

Patrick Bosek: Well,

George Fitzgibbons: cheap.

Patrick Bosek: why not is because the hardware to run it is really expensive.

George Fitzgibbons: Well, that's what I'm saying. Check out fireworks. You've ever heard of fireworks?

Rebecca Lyus: Yeah.

Ashwin Mudaliar: They're uh we're they're a partner of ours.

Patrick Bosek: No.

Ashwin Mudaliar: They're growing like absolute crazy. One of the fastest growing companies. Um yeah, their team their their founders were uh the team inside of Meta that came up with PyTorch.

00:05:02

George Fitzgibbons: Yeah.

Patrick Bosek: Okay.

Ashwin Mudaliar: And so like they're like the OG a lot of this stuff.

Patrick Bosek: Yeah, pie torch is going way

Ashwin Mudaliar: Yeah.

Patrick Bosek: back.

George Fitzgibbons: Uh, it's a good product though. Makes it easy.

Patrick Bosek: Fireworks.

George Fitzgibbons: Oh, got AI on it, too.

Patrick Bosek: Yeah,

George Fitzgibbons: You know what I

Patrick Bosek: as one would expect. Yeah.

Everett Zufelt: Hey

George Fitzgibbons: mean?

Rebecca Lyus: Hello.

Everett Zufelt: everyone.

Rebecca Lyus: Just going to give it one more minute and then we can get started.

Ashwin Mudaliar: It's

Rebecca Lyus: I did see we have George posting about bucket three.

Ashwin Mudaliar: supposed

Rebecca Lyus: I have posted all three buckets just as a refresher for everyone in the chat if people just want to review

George Fitzgibbons: Cool. Uh,

Rebecca Lyus: those.

George Fitzgibbons: and we can take this in any order. My question, so I do have bucket three example. We can use this as a jumping off point, but my question is more how we want to organize GitHub in the aspect

00:06:18

Rebecca Lyus: Yeah.

George Fitzgibbons: of adding open source projects. I would love to review that today. Get some thoughts so we can start adding tangible projects up there because admittedly like I don't really fully track how things are being organized in GitHub right now.

Everett Zufelt: Yep.

Patrick Bosek: So it seemed like the projects were under the hackathon folder in the WG Enterprise agent architecture.

Everett Zufelt: Yep. Yeah,

Patrick Bosek: Is that right?

Everett Zufelt: there's two in there now. There's uh Danielle um at le I think I don't know if the whole one's there yet, but at least the spec is there and then the the multi- agent negotiation one's in there. So, uh uh George, yeah, if you just look under in the GitHub repo, if you look under deliverables hackathon, you'll see there's already two project uh folders there.

George Fitzgibbons: my question. Let's talk about that. Uh because I guess let's define what a project is. Could I share my screen? I'm just very visual.

Everett Zufelt: Yeah, play right.

Rebecca Lyus: different.

00:07:25

George Fitzgibbons: Okay. So when I'm thinking of projects,

Patrick Bosek: Keep going.

George Fitzgibbons: I'm thinking like the actual like builds people can download and run. That's kind of what I would think of the project.

Everett Zufelt: Yeah.

George Fitzgibbons: And so in

Everett Zufelt: Yeah. Agreed.

George Fitzgibbons: deliverables so I can pull this down like can we just have read memes that are like npm install? Like I feel like we're merged into Oh, this is mine. And no, it's not. Uh, never mind. Um, I felt like I'm I just don't And if I'm going to try to say this one more time, I feel like there's too many subjects going on as far as deliverables as far as like I know we talked about the architecture diagrams and like this feels like an overview where again this read me is like if I were to come to this especially for the hackathon I feel like it should be like npm install like how do I quickly spin up this project if that

Daniele Stroppa: I believe that's in the Midia

00:08:37

George Fitzgibbons: makes sense so

Daniele Stroppa: crossing.

Everett Zufelt: Yeah. Like so so if you so

George Fitzgibbons: into the app

Everett Zufelt: Yeah.

George Fitzgibbons: okay so what is the pattern So just to recap again, this is me just being confused. No. Uh I don't know the right answer. I just want to be talk through this so it's more clear. So there is a tangible let's call it a PDF asset that explains a bucket. So if I go into and what I guess I don't fully understand why it's under hackathon. Let me start there too.

Everett Zufelt: um probably doesn't have to be under hackathon. I I think that the the and we can rearrange things if if it makes more sense for people to go through it, but they just I had originally put one there under hackathon because we're building prototypes for a hackathon. So that's that was my only it was my singular and only rationale when I very quickly said where am I going to

George Fitzgibbons: Okay.

Everett Zufelt: stick this stuff I said hey we're doing a hackathon tadada here's where I'm going to stick my code happy happy to put it somewhere else but that's just the only thought that went through my brain

00:09:58

George Fitzgibbons: Okay. And so if again this was just me last night trying to to navigate this. So uh should there be a place where we have again like I'm calling it a PDF but like high level bucket 1 2 3 4 5 and there is kind of this organization of like what the bucket is. And so I can come here and be like,"Oh, bucket five. I can read about it." And then I can see,"Oh, here's a project for bucket five." I can click into that and then I

Everett Zufelt: Yes. A absolutely.

George Fitzgibbons: can.

Everett Zufelt: I I think I hear what you're saying now. I think we've been for the last little bit, I think, pretty focused on the prototypes.

George Fitzgibbons: Yeah.

Everett Zufelt: I know that Tim and Rebecca have been talking about like we'll call it logistics for the hackathon. I think the third thing that we absolutely have to get into place, but that I'll say is uh simple enough that it's probably not like the top priority, but I agree it's missing is sure there's a readme file and let's say there were five prototype folders.

00:11:12

Everett Zufelt: There's there is not none of the rest of the material for how to make sense of and run the hackathon exists.

Patrick Bosek: Cheers.

Everett Zufelt: Yes.

George Fitzgibbons: What

Everett Zufelt: Agreed completely. Agreed completely. There's nothing that says welcome to the hackathon.

George Fitzgibbons: is

Everett Zufelt: It's built around these, you know, four or five archetypes. Here's a quick explanation of each one. Click this link to go. Here's where the project none of that exists yet. 100% agree if that's what if that's what you were sharing. I and I believe it should exist.

Patrick Bosek: Oh,

Everett Zufelt: We do need to create that. We'll call it like that kind of wrapping and educational content. We just haven't done it.

George Fitzgibbons: Okay, then my last question, not last question, I lied. Um, what do we mean by prototype?

Patrick Bosek: heat.

George Fitzgibbons: And I'm sorry to get into names, but what is a prototype? Is that like the the example agents we're making.

Daniele Stroppa: Yeah.

George Fitzgibbons: Okay.

00:12:05

George Fitzgibbons: Uh and correct me if I'm wrong, the prototypes are meant to be. And so now I'll do the jumping off point of three and I have a million things going on. I'm sorry. This agent is like so I made an agent for bucket three. uh open source as an example is a jumping off point and so I think of this as this is what and again I'm happy to adopt the name of names this would be we have prototype we've got prototypes bucket one in there there may be multiple prototypes we've got bucket two and there may be multiple prototypes people can come in easily just download the code deploy run it Like that should be a five minute exercise that people should be able to do whether you know the read me steps are

Daniele Stroppa: I I think the uh the way I don't know I

George Fitzgibbons: kind of

Daniele Stroppa: mean yeah I I try to follow the similar structure to what Everett already

George Fitzgibbons: mpm.

Daniele Stroppa: did for for bucket five for uh for bucket four as well it's more of a build up right it's not a single uh kind of a

00:13:20

George Fitzgibbons: Yeah.

Daniele Stroppa: single command to deploy everything. It's you build different pieces of the uh of the agent in within the within the acetone or within that that time, right? So, it's got different like different milestones. Each of them has kind of different pieces and I guess that's where the you know that education wrapper goes as well,

George Fitzgibbons: Uh

Daniele Stroppa: right? So probably that's that's what we that's what we need to put around these as

George Fitzgibbons: yeah. Okay, I'm tracking. If I were to make a suggestion,

Daniele Stroppa: well.

George Fitzgibbons: it would be kind of to merge these subjects because to the point of like I like how yours like I'm I'm happy to read through the steps but at the end of the day if I can just pull a project down and run it like come to you this like your bucket five like sweet I may want to go through it step by step but I may just want to build it to see

Everett Zufelt: Yeah,

George Fitzgibbons: Yeah.

Everett Zufelt: I'm having a hard time distinguishing the difference in what you're saying.

00:14:35

Everett Zufelt: Can you try to say it differently?

George Fitzgibbons: Yeah.

Everett Zufelt: Like as a de as a let me rephrase as a developer I see code.

George Fitzgibbons: So

Everett Zufelt: I don't magically know what to do with it. So I'm gonna have to read something to get started.

George Fitzgibbons: yeah.

Everett Zufelt: And like at least I I haven't looked at Danielle's but mine has it the one I put up there has a getting started document. And so I would go there and see how to get started.

George Fitzgibbons: Okay. Am I So, am I right to break out? Everett is bucket five in here in this hackathon. Daniela,

Everett Zufelt: That's the one.

George Fitzgibbons: you are four.

Everett Zufelt: That's the one I shared.

Daniele Stroppa: Yes.

Everett Zufelt: It's live. Yeah.

George Fitzgibbons: Oh, okay. Sweet. So, I was saying it backwards because me as a developer, I first thing I want to do is like run the project locally. And so if I come into a five, I can eventually get there and pull the project down, run it.

00:15:33

George Fitzgibbons: I feel like going back to the top level, it's like is the goal to have prototypes. Here's bucket, we've got bucket one.

Patrick Bosek: Hey,

George Fitzgibbons: Within bucket one, we have the documentation like the arc diagrams,

Patrick Bosek: what?

George Fitzgibbons: things of that nature. And then we have prototypes and we have may have multiple prototypes per bucket but you can just you can go learn about it you can read about it but it's tangible code but one tangible thing I can always do or is let's call it front and center is I'm going to start with this project I'm going to download it and I'm going to run it locally. Am I start? Do I make is that I just want to make make sure I I understand.

Patrick Bosek: I'm I'm having a hard time following here. Can I ask a clarifying question? Are we are we talking about the information architecture?

George Fitzgibbons: Yeah.

Patrick Bosek: So the structure of the GitHub repository or are we talking about the methodology around the readme for the individual projects?

00:16:42

George Fitzgibbons: I think the former uh in that I'm just really lost in there and I I just want to put a little structure around it in that I think we should make and I'm going to fully adopt we should make more open-source prototypes and it when I go to the GitHub I should be able to go and be like oh bucket three and then within bucket three there is if we want to do it this way it's oh here's is like the highle architecture i.e. uh diagrams things of that nature and here is a tangible code project I can download and

Patrick Bosek: Yeah. Okay. Can I make a proposal? Sorry, Danielle.

George Fitzgibbons: run

Patrick Bosek: Did you want I can wait if you wanted to comment on that.

Daniele Stroppa: No, no, no.

Patrick Bosek: Okay.

Daniele Stroppa: Go for it.

Patrick Bosek: So, this is actually I kind of in my expertise. I come from tech pubs. So, this is like what we do is organize information like this. Um, let me share my screen real quick.

00:17:38

Patrick Bosek: Uh, okay. So my proposal would be that at this level here that we have hackathon called projects because I think hackathon is ambiguous and what these are is they are all different projects that people can interact with. We put a readme at deliverables. The readme has a description of each project and in the project would have a in the project description it would be a table. It have the name of the project the bucket it occupies. So it's classified under one of our five classifications and the status of that project. So whether or not it is in a prototype or it's in a runnable state or whatever that may be. Um and then we provide a very small amount of additional information if it was helpful on a project by project basis. And then inside of the projects folder, instead of having these these buckets like this, I would have just the projects listed um and use the index here as a methodology for classifying them. Um so people don't have to dig even deeper inside of these um and have to and they don't have to come and try to understand our taxonomy around this folder structure.

00:18:46

Patrick Bosek: Like in my experience, flatter folder structures are better um because you can layer other forms of um of structure on top of them. I think that would be very

Everett Zufelt: I like that. And then I think maybe not to over complicate it

Patrick Bosek: understandable.

Everett Zufelt: but if if we renamed hackathon as project one of the projects is actually the material for delivering the hackathon

Patrick Bosek: Sure.

Everett Zufelt: which is separate from like rel related to but separate from the prototypes.

Patrick Bosek: Yeah, that would be its own project. Um,

Everett Zufelt: This it's only here's some slide content and some speaker notes and how to organize people and things like

Patrick Bosek: yeah.

Everett Zufelt: that.

Patrick Bosek: Yeah. Um, I would also make a recommend I support George's recommendation that the actual agents, the runnable things start with the developer information for how to actually get it going. Um, because I think I'm also a developer by background and like the first thing I want to see is like what are the four commands I like I can stand this up and then play with it.

00:19:54

Patrick Bosek: Um, so I think that makes a lot of sense. That's more preference, but I just wanted to say that I support that that methodology as a standard.

Everett Zufelt: And do and just so that we're all aligned on what we want to standardize around does the concept. So, like if I look in the the thing I put up there, there's a getting started guide, there's a how to demo guide, there's a readme document. Does that does that feel like it's like the the the way we would want to structure that? So, like, you know, in my mind, I pop in there, something says getting started. Well, I'm going to click on that and figure out what to do.

Rebecca Lyus: It feels like that makes sense in that structure.

Daniele Stroppa: So I guess I guess probably we need to I agree with what Patrick was saying right we need to split them up into kind of the two separate things right one is the acaton component of it which is more the explanation educational piece why it's built in a certain way and and how to build it.

00:20:58

Everett Zufelt: What?

Daniele Stroppa: and then the project itself which is the code basically.

Everett Zufelt: Yeah.

Daniele Stroppa: Uh I think

Everett Zufelt: And especially because during a hackathon, some people will want to work on,

Daniele Stroppa: that's

Everett Zufelt: you know, learn about one of those project types and other people want to learn about a different one, right? So, I think it's it's good that there's different examples of projects, but I do I do like the idea of the hackathon stuff. It's just really a a pro called a quote unquote project of its own, right? Uh, it just is how how would you run a hackathon around this information?

Patrick Bosek: And I'm correct understanding that in this um so this bucket which is kind of the information around how to build a a level or a type five, excuse me, archetype five. The meridian crossing is the actual agent, right?

Everett Zufelt: Yes. And if we want to flatten that in,

Patrick Bosek: Yeah.

Everett Zufelt: like I don't remember at the top of my head why I put it in a subfolder there.

00:21:59

Everett Zufelt: So we wanted to if for some reason we felt very strongly about just like flattening that. I don't see a reason why it wouldn't work,

George Fitzgibbons: All

Everett Zufelt: but we could do that.

Patrick Bosek: So for me that would make more sense. Like it's this is not something that I'm like I would get stuck on. But when I came in here and I was trying to digest this on my own, it took me a little while to figure out that Meridian Crossing was like the thing that I installed um to play with this. Um, yeah,

George Fitzgibbons: right.

Patrick Bosek: I think like having the runnable stuff in line with this under projects would just it would make more sense in my mind for that for

Everett Zufelt: Any

Patrick Bosek: those things.

Everett Zufelt: other thoughts on this? What I what I can do is do a PR that does what I think we just all agreed to here. And then as long as people feel good about that, we can merge it in and have that be the new convention.

00:23:03

George Fitzgibbons: Awesome. That sounds good. And I'm happy to be a test dummy in that uh I have three teed up and I have again to maybe summarize I've got two components to it. One is pure what's called PDF documentation about bucket 3 and the other is a tangible agent app that can be run. Okay. Sorry to sidetrack everything, but I was just awfully confused.

Rebecca Lyus: It's all good. I felt like that clarity was needed though. I wouldn't apologize for it.

Patrick Bosek: I found it really valuable for what it's worth.

George Fitzgibbons: Okay,

Patrick Bosek: But again, I'm from tech pubs. very pedantic when it comes to um structure naming.

George Fitzgibbons: I will I take my apology back. Uh, cool. I guess what else is going

Daniele Stroppa: Um I'll have uh bucket for well I'll wait for the uh for the

George Fitzgibbons: on?

Daniele Stroppa: new structure but um I have that I have that ready as well. I just need to uh to push it or to submit the the PR for that but I'll wait for the new for the new structure.

00:24:23

Daniele Stroppa: So I'll do it in that format.

George Fitzgibbons: Cool.

Daniele Stroppa: Um on a side side note side topic what uh what what's the plan? What are we doing uh in Amsterdam uh for the uh I guess this is the will flow into that agent agent build up right.

George Fitzgibbons: Yeah, that that's kind of my expectation and uh why I started getting this ready

Rebecca Lyus: Yeah.

George Fitzgibbons: is um at the agent builder We will have uh tangible assets as far as hey here's documentation resources of what the buckets are. We can use that as a jumping off point to have an informational kind of talk about it and then we say great we're going to build these this afternoon. We've got a bunch of tangible examples that you can pull down and build uh or you can build whatever you want within those kind of boundaries that we call out. uh and we go from there. And I think as far as uh very tactical questions I'll call out. So one is as far as the kind of general question of how do you make tangible agents?

00:25:45

George Fitzgibbons: I think this is where we can come at it in multiple approaches or use the prototypes is uh I've got versell instances that are when you hit deploy it is going to provision everything that you need the gateway uh sandboxes and all that. So that should be an easy kind of onboard to a bucket for people wanting to build. But I

think we can have multiple flavors of that. I know Daniele, you already had uh kind of your pattern baked out and so I think we can have multiple flavors of how you build an agent as far as tactically, but we will have examples of doing it a bunch of different ways.

Daniele Stroppa: Okay, makes sense. Yeah. Um I'll I'll be there um in Amsterdam.

George Fitzgibbons: Sweet.

Daniele Stroppa: So if there's any any need for support in the room or anything like that, happy to happy to do that.

George Fitzgibbons: Oh yeah, that's a good question. We should take more. Who is going to be there? I'm going to be there.

00:26:49

George Fitzgibbons: Uh, sweet people on no camera mute.

Rebecca Lyus: I'm going to

George Fitzgibbons: any YouTube ever. Are you gonna be there?

Everett Zufelt: I will be

George Fitzgibbons: Okay,

Rebecca Lyus: That's three of

George Fitzgibbons: there we go.

Everett Zufelt: there

Rebecca Lyus: us.

George Fitzgibbons: Uh, awesome. Okay. Well, then to that point,

Everett Zufelt: and then and I know Tim Tim will be there.

George Fitzgibbons: Tim will be there.

Rebecca Lyus: Yeah.

George Fitzgibbons: Uh, I talked to Tim about that kind of format because I know he was going to be here today. He's on board with that.

Rebecca Lyus: Yeah.

George Fitzgibbons: And so from that perspective, we can I think we can still work at that macro level of creating these assets. And then maybe in the next couple weeks, we can maybe have a little side session about the people who are going to be there and dig into some of the tactical stuff.

Rebecca Lyus: We have two more of these sessions before MacX, which is absolutely terrifying for me.

George Fitzgibbons: Oh, we're going to be fine.

00:27:48

Rebecca Lyus: There's a lot of back end things that I need to sort out before then. And the

George Fitzgibbons: Well love anything that involves agent labs I guess just ping in the slack.

Rebecca Lyus: next

George Fitzgibbons: Uh but you shouldn't have to worry about that.

Rebecca Lyus: No, that should go rather

George Fitzgibbons: I feel like we'll be good basing that on

Rebecca Lyus: smoothly.

George Fitzgibbons: nothing. We'll be good.

Rebecca Lyus: I have faith in you guys. It'll be fantastic. I asked for cover from my session so I can be there as well to support and actually see

George Fitzgibbons: Cool.

Rebecca Lyus: everyone in person rather than just hide like a goblin as I do every

Daniele Stroppa: Okay.

Rebecca Lyus: event.

George Fitzgibbons: So, it sounds like the marching orders right now ever's going to make a PR based on Patrick's feedback. Patrick, if you want to check out that PR, that'd be awesome. Uh, and and provide any feedback naming. And then Daniel, you're going

to up we've got two examples to upload to it right away to to kind of pressure test the new format, make sure it makes sense.

00:28:52

George Fitzgibbons: And then we'll I feel like once we have the format and we have it down, we can knock out the other bucket prototypes fairly easy. Uh, cool. Anything else? Anything I'm missing?

Rebecca Lyus: I think so. I feel like we've been quite good at actually communicating in Slack about what we're doing. So,

Everett Zufelt: That's because they're

Rebecca Lyus: it doesn't feel I really

Everett Zufelt: developers.

Rebecca Lyus: appreciate

Everett Zufelt: Yes, develop developers don't like talking to people about that.

Rebecca Lyus: it.

Everett Zufelt: So, Slack works very well for us.

Rebecca Lyus: The whole could have

Everett Zufelt: Uh uh I'll say like the ebook got uh not ebook the reference guide got

Rebecca Lyus: been.

Everett Zufelt: published with like content from all of the the different folks who did the writeups on the different archetypes. So that was really good that got uh published today and I think Anjali shared a link to the LinkedIn post in the Slack channel this morning.

Rebecca Lyus: Yes. So, make sure to share on that. Uh I am just doing a gentle reminder to people.

00:29:55

Rebecca Lyus: uh if they want their name associated with the working groups, Please let us know cuz we have it on GitHub who the members are and unless people consent to it saying I don't want to be listed we can't lift you. So you're doing all this amazing work and you don't get credited for it which if you can ping me on Slack, put it in the channel say yes I do want it. We can add you on to the as a GitHub member

George Fitzgibbons: Cool.

Rebecca Lyus: or you can be stealthy and that's perfectly fine as well.

Patrick Bosek: I just posted in Slack. Is that sufficient?

Rebecca Lyus: Let me look.

Everett Zufelt: f*** are your feet doing?

Rebecca Lyus: That is sufficient. Thank

Everett Zufelt: What the f***

Rebecca Lyus: you.

Everett Zufelt: are your feet doing? Sir.

Patrick Bosek: Awesome.

Everett Zufelt: Sir.

George Fitzgibbons: That's

Rebecca Lyus: Oh, I'm not I think that might be

Everett Zufelt: ch children in the children in the background.

Rebecca Lyus: Everett.

Patrick Bosek: Say hi to your

Everett Zufelt: Exactly.

Patrick Bosek: daughter.

George Fitzgibbons: Well, on that note, shall

Everett Zufelt: Exactly. Uh and because I have 30 minutes,

George Fitzgibbons: we?

Rebecca Lyus: Yeah,

Everett Zufelt: I'll probably get the PR up, you know, by the end of a regular time slot.

Patrick Bosek: Everett. Is there anything I can do to help support you on

Rebecca Lyus: that's perfect.

Patrick Bosek: that?

Everett Zufelt: Uh yes, take a look at it when it when it's up. Yeah.

Patrick Bosek: Just like me.

Everett Zufelt: Cool. Thanks everyone.

Patrick Bosek: All right. Thanks. Bye-bye.
